

Docket No. AUS920040063US1

## **ABSTRACT OF THE DISCLOSURE**

### **METHOD AND APPARATUS FOR AUTONOMIC TEST CASE FEEDBACK USING HARDWARE ASSISTANCE FOR DATA COVERAGE**

A method, apparatus, and computer instructions for presenting coverage data relating to data access occurring during execution of code. The coverage data containing data access indicators associated with memory locations is obtained. The data access indicators that have been set by a processor in the data processing system in response to access of the memory locations during execution of the code by the processor are identified to form set data access indicators. Each set instruction access indicator is associated with a portion of the memory locations allocated for the code. A presentation for coverage data is generated, wherein the set data access indicators are identified in the presentation.
